

EXTEMPORE ACTIVITY

IT in Automobile:

"Information Technology has revolutionized the automotive industry, making our vehicles smarter, safer, and more efficient. From onboard diagnostics to advanced driver-assistance systems, IT plays a crucial role in enhancing the driving experience. Modern cars are now equipped with sensors, AI-powered systems, and IoT technology, allowing for real-time monitoring of vehicle health, navigation, and even semi-autonomous driving. Electric vehicles (EVs) also benefit from IT through optimized battery management systems and smart charging infrastructure. In the near future, fully autonomous vehicles, enabled by IT advancements, may transform transportation altogether, making roads safer and reducing human error."

IT in Metro Rail:

"IT is a backbone of the modern metro rail system, ensuring efficient operation, safety, and user convenience. With advanced signaling systems powered by IT, trains can run at closer intervals, reducing waiting times and improving commuter experience. Real-time passenger information systems display train schedules, delays, and provide live updates, enhancing transparency and usability. Ticketing has also evolved with IT integration through digital payments, contactless systems, and mobile apps for easy access. IT-driven predictive maintenance systems identify faults before they cause disruptions, ensuring smoother, uninterrupted service. Metro systems across the world are rapidly adopting IT innovations to make urban transportation smarter, more reliable, and eco-friendly."

IT in Avionics:

"The role of IT in avionics, the electronic systems used on aircraft, is nothing short of transformative. Avionics encompass navigation, communication, monitoring, and flight control systems, all of which rely heavily on IT for precision and reliability. Modern aircraft use IT to integrate sensors, radar, and GPS data, improving flight accuracy and safety. Advanced IT systems allow for automatic pilot functions, reducing pilot workload and ensuring smoother flights. In addition, real-time data sharing between aircraft and ground stations

enables better air traffic control, reducing delays and enhancing safety. IT innovations continue to push the boundaries of avionics, bringing us closer to autonomous flying and more efficient air travel."

Each of these sectors—automobile, metro rail, and avionics—has been dramatically enhanced by the application of IT, improving performance, safety, and user experience across the board
